

SWAPCREDITS (SWC)

Token Presale & Tokenomics Whitepaper | Version 1.1 (Dynamic Model)

1. Executive Summary

SwapCredits is an advanced blockchain-based token project designed around a transparent, dynamic supply model and a structured token distribution framework. The SwapCredits ecosystem utilizes SWC as its native utility and governance-aligned asset.

The initial presale price is established at \$0.04 USDC per SWC. Unlike conventional fixed-supply models where the total supply is arbitrarily predetermined before fundraising, SwapCredits utilizes a dynamic supply architecture. Under this model, the final total token supply is calculated following the conclusion of the presale phase based on finalized participation metrics, while maintaining strict, invariant percentage allocations across all stakeholder categories.

Allocation Category	Percentage Share	Core Purpose
Presale	30%	Distributed to early participants during fundraising
Locked Reserve	30%	Long-term ecosystem development & treasury growth
Community	15%	Ecosystem incentives, user rewards, & growth campaigns
Team	10%	Core contributors, aligned via strict vesting schedules
Investors	10%	Strategic backers and early partners with lock-ups
Liquidity Pool	5%	Initial DEX/CEX market liquidity provisioning

2. Vision & Core Philosophy

SwapCredits aims to establish a transparent token ecosystem where participants can clearly understand how supply is determined, how tokens are distributed, and how long-term ecosystem stability is managed.

CORE PRINCIPLE

Transparent mechanics before marketing. By publishing the exact mathematical relationship and allocation structures governing the token, SwapCredits ensures complete clarity for all ecosystem participants.

3. Dynamic Token Supply Mechanism

3.1 Why SwapCredits Uses Dynamic Supply

SwapCredits implements a dynamic supply model to align token generation with actual ecosystem demand demonstrated during the presale phase. Rather than selecting an arbitrary total supply number out of context, the supply scales proportionally with participation, ensuring that structural proportions remain mathematically locked.

3.2 How the Dynamic Supply Operates

- The presale price is fixed at \$0.04 USDC per SWC.
- The presale allocation represents exactly 30% of the final total token supply.
- Once the presale concludes and eligible contributions are verified, the final total token supply is calculated dynamically based on the total tokens required to satisfy the 30% presale allocation.
- Consequently, all other allocation categories scale proportionally to match the final calculated supply, while their respective percentage shares remain completely unchanged.

4. Token Allocation Breakdown

Regardless of the final absolute supply calculated at the close of the presale, percentage shares remain strictly fixed:

1. Liquidity Pool (5%): Supports stable initial trading environments following token generation.
2. Presale Allocation (30%): Primary early distribution mechanism at \$0.04 USDC.
3. Team Allocation (10%): Core development alignment subject to multi-month cliff and linear vesting.
4. Investor Allocation (10%): Strategic partner allocation with structured lock-ups.
5. Community Allocation (15%): Ecosystem grants, user incentives, and promotional programs.
6. Locked Reserve (30%): Long-term ecosystem expansion and treasury requirements.

5. Valuation & Transparency Matrix

Because SwapCredits utilizes a dynamic supply model, the Fully Diluted Valuation (FDV) is directly tied to the final supply established at presale completion:

Final Total Supply	Presale Price	Implied Fully Diluted Valuation (FDV)
50,000,000 SWC	\$0.04	\$2,000,000
100,000,000 SWC	\$0.04	\$4,000,000
250,000,000 SWC	\$0.04	\$10,000,000
500,000,000 SWC	\$0.04	\$20,000,000

6. Roadmap & Risk Factors

6.1 Strategic Roadmap

- Phase 1 — Foundation: Concept finalization, tokenomics architecture, smart contract design, and web portal setup.
- Phase 2 — Presale Execution: Public presale launch, community engagement, and real-time transaction monitoring.
- Phase 3 — Token Generation & Launch: Final supply calculation, smart contract deployment, and liquidity provisioning.
- Phase 4 — Ecosystem Expansion: Rollout of utility programs, governance research, and strategic integrations.

6.2 Risk Factors & Disclaimers

Digital assets involve substantial risk, including market volatility, smart-contract vulnerabilities, liquidity fluctuations, and regulatory shifts. Participants should independently evaluate the project. SwapCredits makes no guarantees regarding future exchange listings, price appreciation, or market capitalizations.
